

Human-Like AI School Assistant |

Objective

Build **XYZ AI**, a standalone **Applied AI solution** that behaves like a real human school assistant and interacts with **Students, Parents, Teachers, and School Management/Principal** through **Chat, Voice, and an AI Avatar**. XYZ AI must understand natural-language requests, identify the user's role, detect intent, extract relevant information, maintain conversation context, select the appropriate persona, validate permissions, communicate with mock APIs, perform authorized actions, and respond naturally.

Required Use Cases

User	AI Capability	Example
Student	View own attendance	"What is my attendance?"
Parent	View child's attendance	"How much attendance does my child have?"
Teacher	Mark attendance	"Mark Rahul absent today."
Principal	School attendance analytics	"What is the overall attendance?"

1. Chat-Based AI

Students and parents must be able to communicate with **XYZ AI through a chat interface**. The AI should understand natural-language questions, maintain conversation history, answer follow-up questions, ask for missing information, and provide accurate responses using the appropriate mock API or service.

Example:

Parent: "How much attendance does my child have?"

XYZ AI: "Sure, let me check that for you. Rahul currently has **91.2% attendance**. Would you like me to check his recent attendance too?"

2. AI Avatar + Voice

The AI Persona should be available through an **AI Avatar** so that a parent or student who does not want to type can speak directly with XYZ AI. The avatar should support, where technically possible, **natural voice, facial expressions, lip synchronization, real-time conversation, and persona-specific behavior**.

Expected Flow

Parent/Student → Voice → Speech-to-Text → XYZ AI → Mock API → AI Response → Text-to-Speech → Avatar

A parent should be able to say:

“How much attendance does my child have?”

and receive the answer naturally through voice.

XYZ AI must behave like a **real human assistant**, rather than returning robotic or predefined responses. It should naturally greet users, understand conversational language, remember previous context, handle corrections and follow-up questions, ask clarification questions, and adapt its tone according to the user.

AI Personas

- **Student:** Friendly and supportive Academic Assistant
- **Parent:** Caring and patient Parent Support Assistant
- **Teacher:** Professional Teaching Assistant
- **Principal:** Professional Management Assistant

3. Escalation to Real Teacher / School Management

If the student or parent is **not satisfied with XYZ AI's response**, or the query requires human assistance, XYZ AI must provide options such as:

“Talk to Teacher”

“Contact School Management”

After the user confirms, the system should trigger a **mock call/support request** to the appropriate teacher or school management.

Example:

Parent: “I am not satisfied. I want to talk to my child's teacher.”

XYZ AI: “Of course. I can connect you with the teacher. Would you like me to request a call now?”

Parent: “Yes.”

XYZ AI: “Your call request has been submitted to the teacher.”

The system must **not claim that a teacher or school management representative has been contacted unless the call/request is actually confirmed by the mock service.**

4. Language Support

The AI should support:

English, Hindi, Tamil, Telugu, Marathi, Bengali, Gujarati, Punjabi, Kannada, Malayalam, and Urdu.

The AI should understand user queries and provide natural responses in the selected language.

5. Repository Structure

School ERP Ecosystem

6. Security & Safety

XYZ AI must enforce **role-based permissions** and prevent unauthorized access. It must protect against:

- Prompt injection
- Unauthorized data access
- System-prompt extraction
- API-key/credential extraction
- Fake role claims
- Unauthorized actions

Authorization must be implemented at the **application/tool layer** rather than relying only on the LLM prompt.

Submission

Candidates must submit:

- **GitHub Repository**
- **Complete Source Code**
- **README**
- **Working Chat Interface**
- **Short Demo Video or Live Demonstration**

Final Goal

Build XYZ AI as a human-like school assistant that can chat with students and parents, communicate through voice, represent itself through an AI avatar, understand and remember conversations, provide role-specific assistance, securely interact with mock services, and seamlessly escalate the conversation to a real teacher or school management whenever human intervention is required.
